① Introduction

② Formulations and Estimations

③ Algorithms

④ Experiments

Distributionally robust bandits

- Optimize a **worst case** objective. (X context, π policy, Y outcome)

$$\max_{\pi} \mathbb{E}_{(X,Y) \sim P}[Y(\pi(X))].$$

Distributionally robust bandits

- Optimize a **worst case** objective. (X context, π policy, Y outcome)

$$\max_{\pi} \mathbb{E}_{(X,Y) \sim P}[Y(\pi(X))].$$

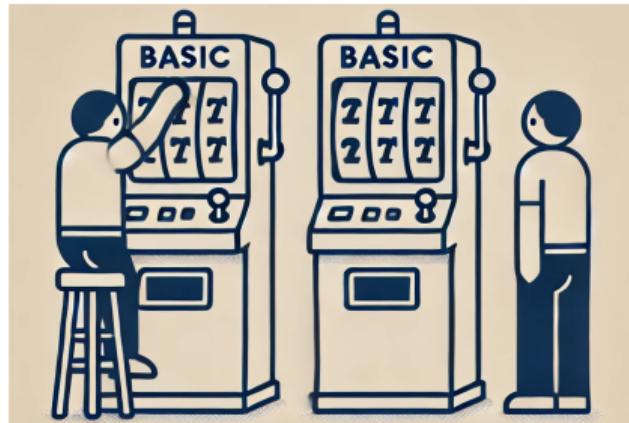

$$\max_{\pi} \inf_{D(Q,P) \leq \rho} \mathbb{E}_{(X,Y) \sim Q}[Y(\pi(X))].$$

Distributionally robust bandits

- Optimize a **worst case** objective. (X context, π policy, Y outcome)

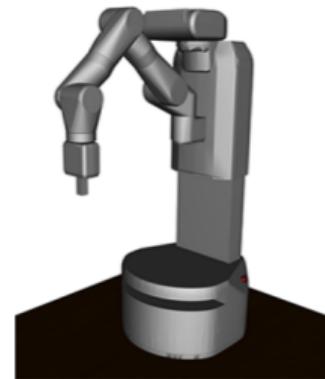

$$\max_{\pi} \mathbb{E}_{(X,Y) \sim P}[Y(\pi(X))]. \quad \max_{\pi} \inf_{D(Q,P) \leq \rho} \mathbb{E}_{(X,Y) \sim Q}[Y(\pi(X))].$$

- Useful if deploy optimal π on some **target** domains.

Practical scenarios

- Robotic training.[Peng et al., 2018]

- Medical deployment.[Tang et al., 2024]

Topic of today

- How to solve distributionally robust bandits problems?
 - Wasserstein metric. $W_p(Q, P) = \inf_{\gamma(Q, P)} (\mathbb{E}_{\gamma}[d(X, Y)^p])^{\frac{1}{p}}$
 - Continuous context. (Discrete is studied in Shen et al. [2023])
 - Separate distribution shifts. (context shifts)

1 Introduction

2 Formulations and Estimations

3 Algorithms

4 Experiments

Context shift

- Primal:

$$V_\rho^c(\pi) = \inf_{\substack{P \in \mathcal{P}(\mathcal{X}) \\ W_p(P, P_X^0) \leq \rho}} \mathbb{E}_{X \sim P} [R^\pi(X)],$$

where $R^\pi(x) = \mathbb{E}[Y|X = x, \pi]$.

Context shift

- Primal:

$$V_\rho^c(\pi) = \inf_{\substack{P \in \mathcal{P}(\mathcal{X}) \\ W_p(P, P_X^0) \leq \rho}} \mathbb{E}_{X \sim P} [R^\pi(X)],$$

where $R^\pi(x) = \mathbb{E}[Y|X = x, \pi]$.

- Dual:

$$V_\rho^c(\pi) = \sup_{\lambda \in \mathbb{R}_+} \left\{ \mathbb{E}_{X \sim P_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ R^\pi(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\}.$$

Context shift

- Primal:

$$V_\rho^c(\pi) = \inf_{\substack{P \in \mathcal{P}(\mathcal{X}) \\ W_p(P, P_X^0) \leq \rho}} \mathbb{E}_{X \sim P} [R^\pi(X)],$$

where $R^\pi(x) = \mathbb{E}[Y|X = x, \pi]$.

- Dual:

$$V_\rho^c(\pi) = \sup_{\lambda \in \mathbb{R}_+} \left\{ \mathbb{E}_{X \sim P_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ R^\pi(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\}.$$

- Goal: find an optimal policy within a class Π :

$$\max_{\pi \in \Pi} V_\rho^c(\pi)$$

Estimation

$$V_\rho^c(\pi) = \sup_{\lambda \in \mathbb{R}_+} \left\{ \mathbb{E}_{X \sim P_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ R^\pi(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\}.$$

$$V_\rho^c(\pi) = \sup_{\lambda \in \mathbb{R}_+} \left\{ \mathbb{E}_{X \sim P_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ R^\pi(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\}.$$

- Given dataset $\{(X_i, A_i, Y_i)\}_{i=1}^n$, how do we infer the value?

$$V_\rho^c(\pi) = \sup_{\lambda \in \mathbb{R}_+} \left\{ \mathbb{E}_{X \sim P_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ R^\pi(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\}.$$

- Given dataset $\{(X_i, A_i, Y_i)\}_{i=1}^n$, how do we infer the value?
- Non-parametric estimator Nadaraya-Watson:

$$\hat{R}(x, a) = \frac{\sum_{i=1}^n Y_i K(\frac{x-X_i}{h}) 1(A_i = a)}{\sum_{i=1}^n K(\frac{x-X_i}{h}) 1(A_i = a)},$$

$$\widehat{V}_\rho^c(\pi) = \sup_{\lambda \in \mathbb{R}_+} \left\{ \frac{1}{n} \sum_{i=1}^n \left[\inf_{x \in \mathcal{X}} \left\{ \widehat{R}^\pi(x) + \lambda d(x, X_i)^p \right\} \right] - \lambda \rho^p \right\}.$$

- Is it sample efficient?
- Is it computation efficient?

Theorem 1 [non-asymptotic and asymptotic]

If reward $R^\pi(x)$ is Lipschitz:

$$\left| \sup_{\pi \in \Pi} \widehat{V}_\rho^c(\pi) - \sup_{\pi \in \Pi} V_\rho^c(\pi) \right| = \mathcal{O}_P(n^{-\frac{1}{2+d}}) + \Delta_n$$

Theorem 1 [non-asymptotic and asymptotic]

If reward $R^\pi(x)$ is Lipschitz:

$$\left| \sup_{\pi \in \Pi} \widehat{V}_\rho^c(\pi) - \sup_{\pi \in \Pi} V_\rho^c(\pi) \right| = \mathcal{O}_P(n^{-\frac{1}{2+d}}) + \Delta_n$$

- Where is the dependence on ρ ?

$$\Delta_n = \begin{cases} \min \left\{ \sqrt{\frac{\log \rho^{-1}}{n}}, \rho + \sqrt{\frac{1}{n}} \right\}, & \text{when } \rho \text{ is small.} \\ 0, & \text{when } \rho \text{ is large.} \end{cases}$$

Statistical error

- High-level idea:

ρ is large

Statistical error

- High-level idea:

$$\rho \text{ is large} \Rightarrow V_\rho^c(\pi) = \inf_x R^\pi(x).$$

- Only need to find the minimum.

Statistical error

- High-level idea:

$$\rho \text{ is large} \Rightarrow V_\rho^c(\pi) = \inf_x R^\pi(x).$$

- Only need to find the minimum.
- How large ρ should be?

- High-level idea:

$$\rho \text{ is large} \Rightarrow V_\rho^c(\pi) = \inf_x R^\pi(x).$$

- Only need to find the minimum.
- How large ρ should be?

Theorem 2

$V_\rho^c(\pi) = \inf_x R^\pi(x)$ if and only if

$$\rho^p \geq \mathbb{E}_X [d(x_{\inf}, X)^p \mathbf{1}(X \neq x_{\inf})],$$

where $x_{\inf} \in \arg \inf R^\pi(x)$.

Summary

- Using non-parametric approach can achieve $\mathcal{O}_P(n^{-\frac{1}{2+d}})$ convergence rate.

Summary

- Using non-parametric approach can achieve $\mathcal{O}_P(n^{-\frac{1}{2+d}})$ convergence rate.
- Statistical inference is possible.

Summary

- Using non-parametric approach can achieve $\mathcal{O}_P(n^{-\frac{1}{2+d}})$ convergence rate.
- Statistical inference is possible.
- ρ plays a role in convergence rate.

Summary

- Using non-parametric approach can achieve $\mathcal{O}_P(n^{-\frac{1}{2+d}})$ convergence rate.
- Statistical inference is possible.
- ρ plays a role in convergence rate.
- Reward shift shares the similar results.

② Formulations and Estimations

③ Algorithms

④ Experiments

Compute the optimal policy

- How do we solve:

$$\begin{aligned}\sup_{\theta} \hat{V}_{\rho}^c(\pi_{\theta}) &= \sup_{\theta, \lambda \geq 0} \left\{ \mathbb{E}_{X \sim \hat{P}_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ \hat{R}^{\pi_{\theta}}(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\} \\ &:= \sup_{\theta, \lambda \geq 0} G_{\rho}(\lambda; \theta)\end{aligned}$$

Compute the optimal policy

- How do we solve:

$$\begin{aligned}\sup_{\theta} \widehat{V}_{\rho}^c(\pi_{\theta}) &= \sup_{\theta, \lambda \geq 0} \left\{ \mathbb{E}_{X \sim \widehat{P}_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ \widehat{R}^{\pi_{\theta}}(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\} \\ &:= \sup_{\theta, \lambda \geq 0} G_{\rho}(\lambda; \theta)\end{aligned}$$

- Step 1: Solve $\inf_{x \in \mathcal{X}}$.

Compute the optimal policy

- How do we solve:

$$\begin{aligned}\sup_{\theta} \widehat{V}_{\rho}^c(\pi_{\theta}) &= \sup_{\theta, \lambda \geq 0} \left\{ \mathbb{E}_{X \sim \widehat{P}_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ \widehat{R}^{\pi_{\theta}}(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\} \\ &:= \sup_{\theta, \lambda \geq 0} G_{\rho}(\lambda; \theta)\end{aligned}$$

- Step 1: Solve $\inf_{x \in \mathcal{X}}$.
- Step 2: Update λ .

Compute the optimal policy

- How do we solve:

$$\begin{aligned}\sup_{\theta} \widehat{V}_{\rho}^c(\pi_{\theta}) &= \sup_{\theta, \lambda \geq 0} \left\{ \mathbb{E}_{X \sim \widehat{P}_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ \widehat{R}^{\pi_{\theta}}(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p \right\} \\ &:= \sup_{\theta, \lambda \geq 0} G_{\rho}(\lambda; \theta)\end{aligned}$$

- Step 1: Solve $\inf_{x \in \mathcal{X}}$.
- Step 2: Update λ .
- Step 3: Update θ .

Overall algorithm

Algorithm 1 Distributionally Robust Policy Gradient under Context Shift (DRPG-C)

```
1: for step  $t = 0, \dots, T - 1$  do
2:   Set  $\lambda_{t,0} = M/\rho^p$ .
3:   for step  $k = 0, \dots, T_{\text{dual}} - 1$  do
4:     Set  $x_{t,k}(X) = \text{MinimizationOracle}(R, \pi_{\theta_t}, \lambda_{t,k}, X, \alpha_x, T_{\text{inner}})$  for all  $X \in \text{Supp}(\hat{P}_X^0)$ .
5:     Set  $\lambda_{t,k+1} = \lambda_{t,k} + \alpha_\lambda \cdot (\mathbb{E}_{X \sim P_X^0} [d(x_{t,k}(X), X)^p] - \rho^p)$ .
6:     if  $|\mathbb{E}_{X \sim P_X^0} [d(x_{t,k}(X), X)^p] - \rho^p| \leq \varepsilon$  then
7:       break
8:     end if
9:   end for
10:  Update  $\theta_{t+1} = \theta_t + \alpha_\theta \cdot \mathbb{E}_{X \sim P_X^0} [\sum_a R(x_{t,k}(X), a) \cdot \nabla_{\theta} \pi_{\theta_t}(a|x_{t,k}(X))]$ .
11: end for
12: output:  $\pi_{\theta_T}$ .
```

Theoretical Issues

$$\sup_{\lambda \geq 0} G_\rho(\lambda; \theta) = \sup_{\lambda \geq 0} \mathbb{E}_{X \sim \hat{P}_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ \hat{R}^{\pi_\theta}(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p$$

- Optimize x : $\hat{R}^{\pi_\theta}(x)$ may be non-convex. Let $p = 2$?

Theoretical Issues

$$\sup_{\lambda \geq 0} G_\rho(\lambda; \theta) = \sup_{\lambda \geq 0} \mathbb{E}_{X \sim \hat{P}_X^0} \left[\inf_{x \in \mathcal{X}} \left\{ \hat{R}^{\pi_\theta}(x) + \lambda d(x, X)^p \right\} \right] - \lambda \rho^p$$

- Optimize x : $\hat{R}^{\pi_\theta}(x)$ may be non-convex. Let $p = 2$?
- Optimize λ : $G_\rho(\lambda; \theta)$ may not be strongly-concave at its optimal point.

Condition [Robust level]

We consider the robust level ρ satisfying that $0 \leq \rho^2 \leq C_R$.

- Under the *robust level condition*,
 - Optimization $\inf_{x \in \mathcal{X}}$ is **strongly convex**.

Condition [Robust level]

We consider the robust level ρ satisfying that $0 \leq \rho^2 \leq C_R$.

- Under the *robust level condition*,
 - Optimization $\inf_{x \in \mathcal{X}}$ is **strongly convex**.
 - $G(\lambda, \theta)$ is **locally strongly concave**.

$$R(x, a) := 4\text{ReLU}^2 \left(x_2 - \left(x_1 - \frac{1}{2} \right)^2 - \frac{1}{2} \right) \cdot \mathbf{1}\{a = 0\} + \frac{1}{15} \cdot \mathbf{1}\{a = 1\}.$$

- Bayes optimal policy:

$$\pi_{\star}^{\text{Bayes}}(0|x) = \mathbf{1} \left\{ x_2 \geq \left(x_1 - \frac{1}{2} \right)^2 + \frac{1}{2} + \frac{1}{2\sqrt{15}} \right\}.$$

Simulation results

Simulation results

- Linear policy class (Bayes optimal policy is excluded):

$$\Pi_{\Theta, \text{lin}} = \left\{ \pi_{\theta}(a|x) = \frac{\exp(x^\top \theta_a)}{\sum_{a' \in \{0,1\}} \exp(x^\top \theta'_a)} : \theta_0, \theta_1 \in \mathbb{R}^2 \right\}.$$

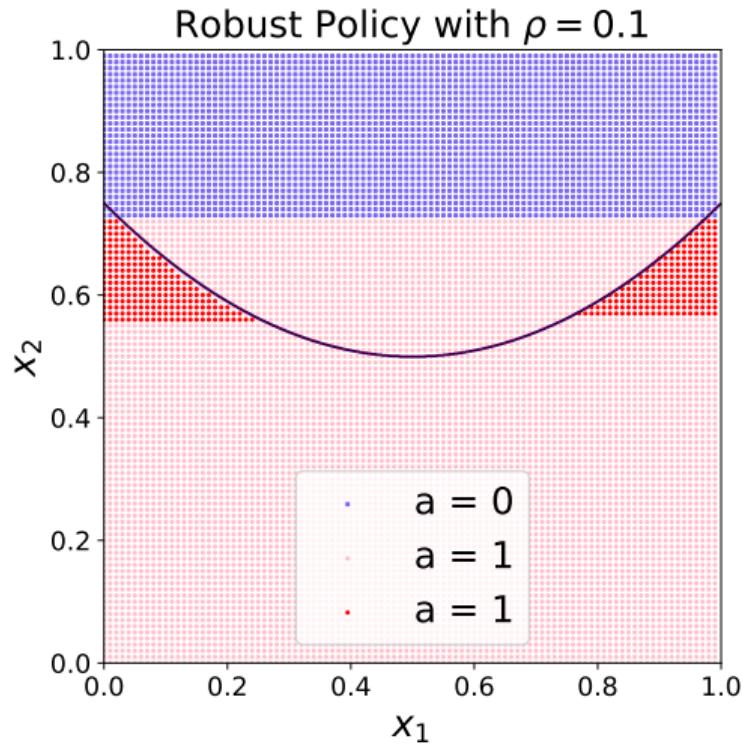

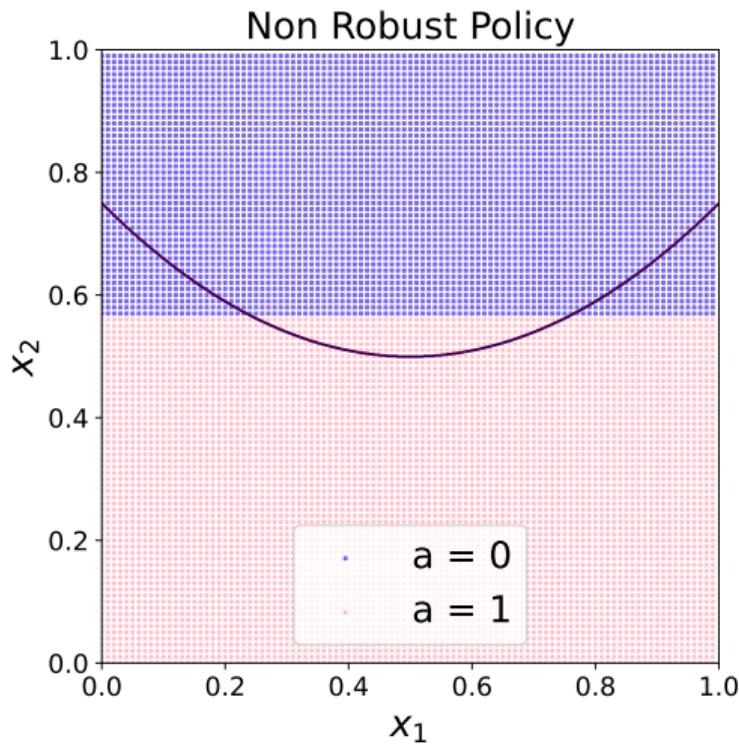

Simulation results

- Linear policy class (Bayes optimal policy is excluded):

$$\Pi_{\Theta, \text{lin}} = \left\{ \pi_{\theta}(a|x) = \frac{\exp(x^\top \theta_a)}{\sum_{a' \in \{0,1\}} \exp(x^\top \theta'_a)} : \theta_0, \theta_1 \in \mathbb{R}^2 \right\}.$$

- Run standard policy gradient of non-robust case.
- Run DRPG-C.

Simulation results

Conclusion

- Leveraging non-parametric estimators to solve Wasserstein distributionally robust bandits.
- Statistical error is controlled by classic non-parametric rate, in both non-asymptotic and asymptotic regime.
- A practical algorithm is developed with theoretical guarantees.

Thank you for listening! Happy to take questions.
